

Day 15
Rohit Raj Singh

Problem Solving

What was the most difficult problem you faced, and how did you solve it?

The most difficult part was handling database-level validation and maintaining consistency between the API validation and PostgreSQL constraints. Initially, some invalid or duplicate data was reaching the database and generating `IntegrityError`, which was difficult to handle properly at the API level. I solved this by combining Pydantic validation with SQLAlchemy exception handling, using transactions and `rollback()` whenever a database operation failed. I also mapped database errors to appropriate HTTP responses such as `409 Conflict` and `400 Bad Request`. This helped me understand how validation should work at both the API layer and database layer.

8. Self-Review

If you had another two days, what would you improve?

If I had two more days, I would improve the project by adding **automated test cases**, better **API documentation**, and more advanced validation and error handling. I would also improve the logging system and test the API with more edge cases to make it more reliable and production-ready.

GIT REPO

The screenshot shows a GitHub repository page for 'Bootamp-rohit-from-day6' by user 'rohithsingh889'. The repository is public and has 67 commits. The file list on the left includes 'Day 6', 'Day 7', 'Documents', 'FASTAPIdemoprojectstructure', 'day 11', 'day 12', 'day 13 FASTAPI', 'day 14', 'day 8', 'day 9', 'day_10', '.gitignore', 'README.md', and 'test.py'. The right sidebar shows the repository's metadata, including no description, website, or topics provided, and no releases or packages published. The language usage bar shows Python at 77% and PLpgSQL at 23%.

File	Commit Message	Time Ago
Day 6	Update headings in README.md for consistency	3 weeks ago
